

# Understanding Neurodiversity

## Evidence-based Practical Strategies

- Neurodiversity is an umbrella term encompassing various conditions
- Strategies will differ depending on the student and their diagnosis so it is important to understand each individual to know what works best for them
- Collaborate with students, families and other support personnel in the student's life to work out suitable strategies for ensuring inclusion in education
- Implement the Universal Design for Learning into classrooms by ensuring multiple means of engagement, representation, action and expression
- Be aware of misconceptions and misunderstandings around neurodiversity; implement evidence-based practices

## Supporting Indigenous Students

- Cultural competence is essential: words and terms such as 'autism' may be 'unheard of' and not exist in other languages
